ECONOMIC ANALYSIS DIVISION • MARCH 2025

▶ Figure 1: Cheyenne Economic Health Index as of January 2025

Index: January 2011 = 100

Note: All four components of the ChEHI are seasonally adjusted. Additionally, sales and use tax collections and home prices are inflation adjusted.

108.1

Note: Shaded areas represent U.S. recessions

▶ Figure 2: Change in ChEHI - Last 6 Months

Year-over-year percent change

| Aug-24 | Sep-24 | Oct-24 | Nov-24 | Dec-24 | Jan-25 |
| --- | --- | --- | --- | --- | --- |
| -0.8% | -0.9% | -0.5% | -0.5% | -0.7% | -0.5% |
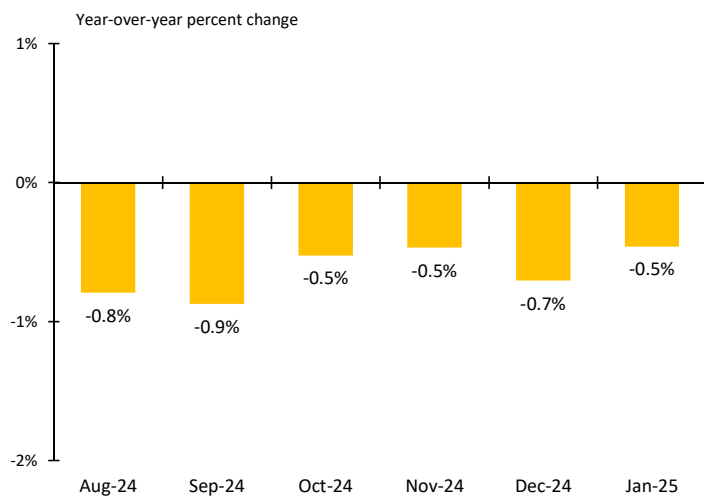

▶ Figure 3: Change in Components of ChEHI - January 2025

Year-over-year percent change

| Employment Rate (65%) | Total Employment (26%) | Total S&U Taxes (4%) | Average Home Value (5%) |
| --- | --- | --- | --- |
| -0.6% | 0.6% | 3.0% | 0.3% |

Note: Values in parantheses are the weights for each component of the ChEHI.
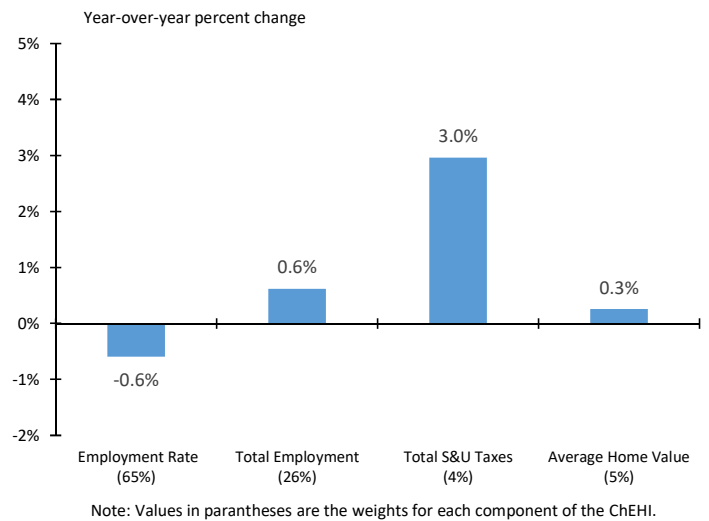

▶ Figure 4: Laramie County and Wyoming Unemployment Rate (Not Seasonally Adjusted or NSA)

— Wyoming
— Cheyenne

4.4%

▶▶ SUMMARY: The Cheyenne Economic Health Index (ChEHI) reported a value of 108.1 in January (see Figure 1). This value is less than the January 2024 value of 108.6.

▶▶ As seen in Figure 2, in each of the past six months (August 2024 - January 2025), the ChEHI reported year-over-year decreases, with the largest decrease occurring in September (-0.9%).

▶▶ Three of the four ChEHI components increased in January compared to January 2024, with total sales & use tax collections increasing the most, up 3.0% (see Figure 3). Employment rate saw the only decrease, down 0.6%.

▶▶ The unemployment rate (NSA) for Laramie County in January was 4.4%, higher than the January 2024 rate of 3.7% and the state-wide January 2025 rate of 4.3% (see Figure 4).

Note: Both unemployment rates in Figure 4 are not seasonally adjusted.

▶ Figure 5. Laramie County Total Nonfarm Employment (Seasonally Adjusted)

Thousands of jobs

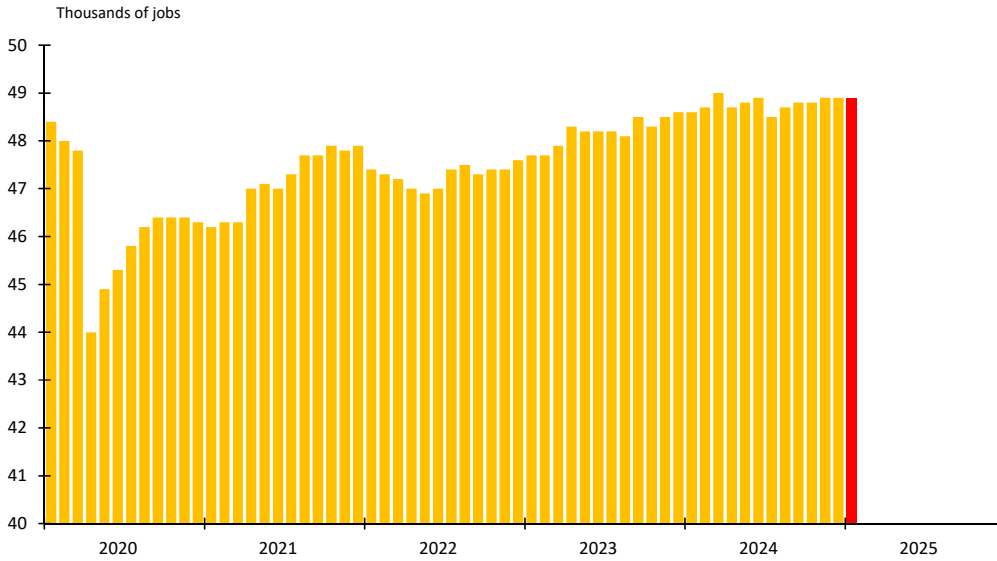

▸ The total number of nonfarm payroll jobs in January was 48,900, higher than the January 2024 number by 300 (+0.6%) (see Figure 5). Total employment appears to have moderated, staying at the same level for the last three months.

▸ NOTE: MSA stands for Metropolitan Statistical Area. The Cheyenne MSA covers all of Laramie County.

▶ Figure 6. Laramie County 4% Sales and Use Tax Collections (1-Month Lag)

Millions of Dollars

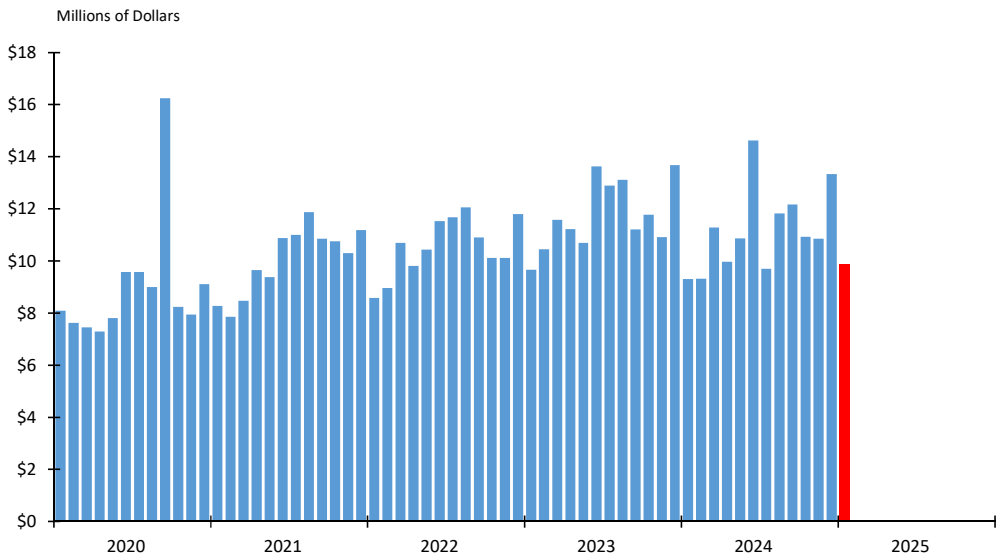

▸ Laramie County's collection of the 4% sales and use tax was $9.9 million in January, $0.6 million more (+6.1%) than January 2024 (see Figure 6).

Note: The value for January 2025 in Figure 6 is actually collections from February 2025 because there is approximately a 1-month lag between collections and sales activity.

▶ Figure 7. Change in Laramie County Average Home Value

Year-over-year percent change

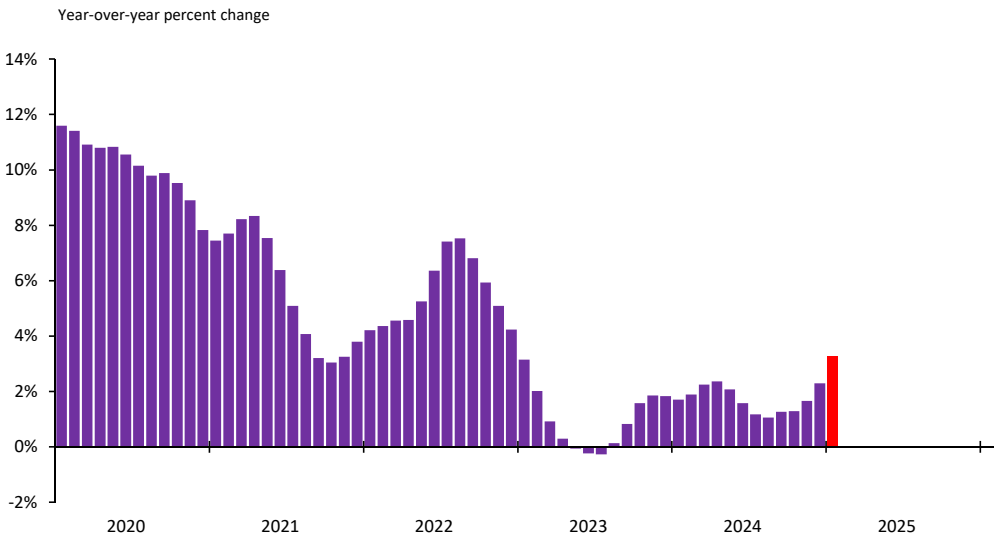

▸ Laramie County's average home value was $368,200 in January, 3.3% higher than January 2024 (see Figure 7).

# Cheyenne Economic Health Index Addendum

The Cheyenne Economic Health Index (ChEHI) is a coincident economic indicator designed to provide a current assessment of Laramie County's economy. There are four components of the ChEHI. The first two components, unemployment rate and total nonfarm employment, are included to capture overall labor market activity for Laramie County. The third component, sales and use tax collections, captures economic activity related to taxable sales in Laramie County. The fourth component, average home value, serves as a proxy for the housing market.

Unemployment Rate: The first component of the ChEHI is the unemployment rate. This statistic measures the percentage of people in Laramie County actively looking for work but do not have jobs. In the ChEHI model, the employment rate (100% minus the unemployment rate) is indexed rather than the unemployment rate because an increase in the employment rate, similar to an increase in total employment, sales and use tax collections, and home prices, is considered to be a positive for the county's economy. The unemployment rate is available monthly, not seasonally adjusted, from the U.S. Bureau of Labor Statistics. The data is then seasonally adjusted.

Total Nonfarm Employment: The second component of the ChEHI is total nonfarm employment. This statistic measures the number of people who have wage or salary jobs in Laramie County. The total nonfarm employment is available monthly, seasonally adjusted, from the U.S. Bureau of Labor Statistics.

Sales & Use Tax: The third component of the ChEHI is the sales and use tax collected from the state's 4 percent tax rate. Because sales and use tax collections the county receives for a given month represent transactions that took place 4 to 6 weeks prior, the data is lagged one month in the ChEHI model. This statistic is available monthly from the State of Wyoming's Department of Revenue. The data is adjusted for inflation using the Consumer Price Index for All Urban Consumers from the U.S. Bureau of Labor Statistics. The data is also seasonally adjusted.

Average Home Value: The fourth component of the ChEHI is the average home value. This statistic is available monthly from Zillow. This variable is defined as the average home value for a single family home. The data is adjusted for inflation using the Consumer Price Index for All Urban Consumers from the U.S. Bureau of Labor Statistics. The data is also seasonally adjusted.

Methodology: Each series for the components discussed above are standardized starting in January 2005, resulting in a value of 100 for each component and the ChEHI. As each component changes from month to month, the ChEHI value changes. Next, the standard deviation of each component's standardized series values is calculated, followed by the calculation of the inverse of each component's standard deviation. Lastly, the individual inverse standard deviations are standardized, resulting in weights that sum to 1. The rationale for this weighting approach is that the components that are more stable over time will have a smaller standard deviation and thus, a larger inverse standard deviation and weight. A large shift in a typically stable data series would provide a better signal of a change in the economy than a large shift in a data series that typically has large fluctuations. Therefore, this weighting approach allows the ChEHI to put a larger weight on the more stable components so that if they do experience a large shift, the ChEHI's value will be affected more to represent the change in the county's economic conditions. Lastly, a 3-month moving average is used in order to smooth out the index. This helps eliminate large "spikes" that may occur due to a certain component recording an unusually high or low value in a given month.
